

Self-organizing metallic atom chains on semiconductor surfaces

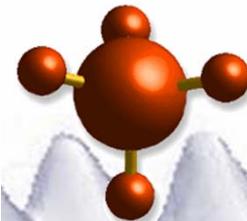

Harold Zandvliet

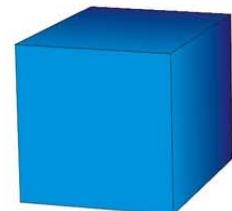

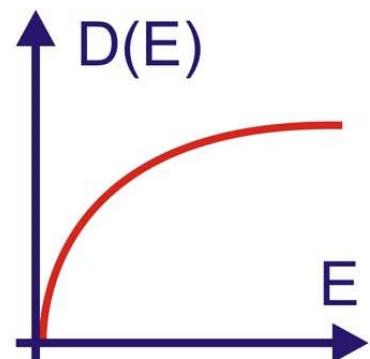

**MESA⁺ Institute for Nanotechnology, University of
Twente**

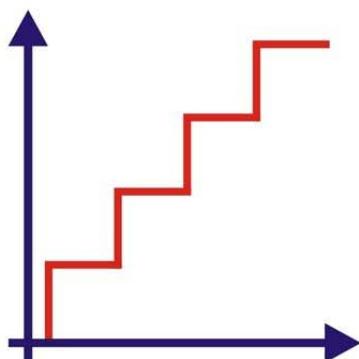

MSU 2014

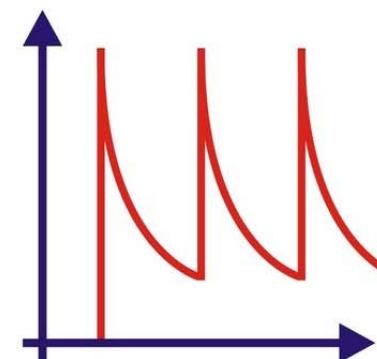

3D → 2D → 1D → 0D

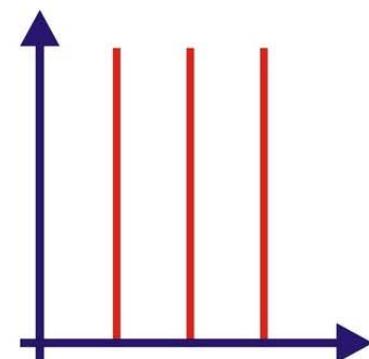

(A)

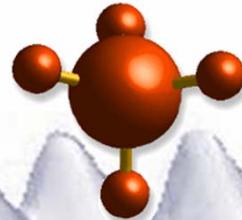

(B)

(C)

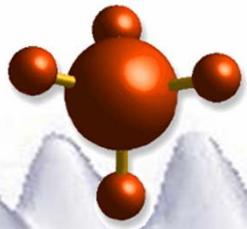

(D)

Physics in 2D

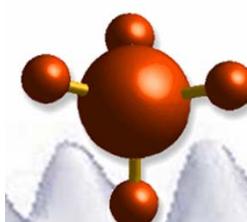

- 2DEG (integer and fractional quantum Hall effect)
- Graphene ($E(k) \sim k$, relativistic electrons, Dirac equation/cones etc.)
- Topological insulators

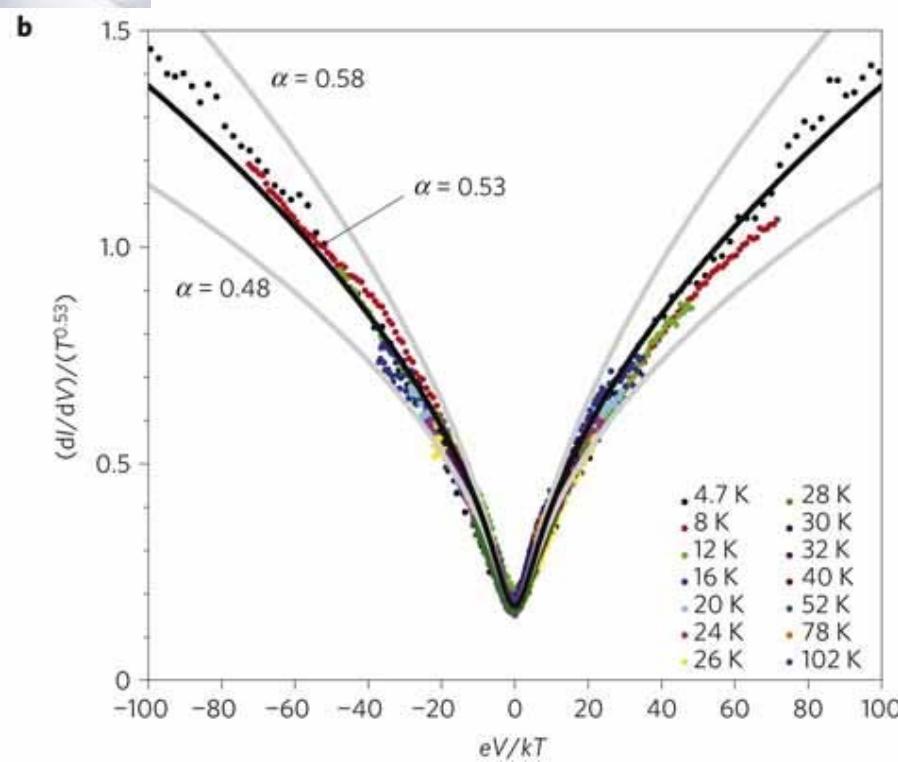

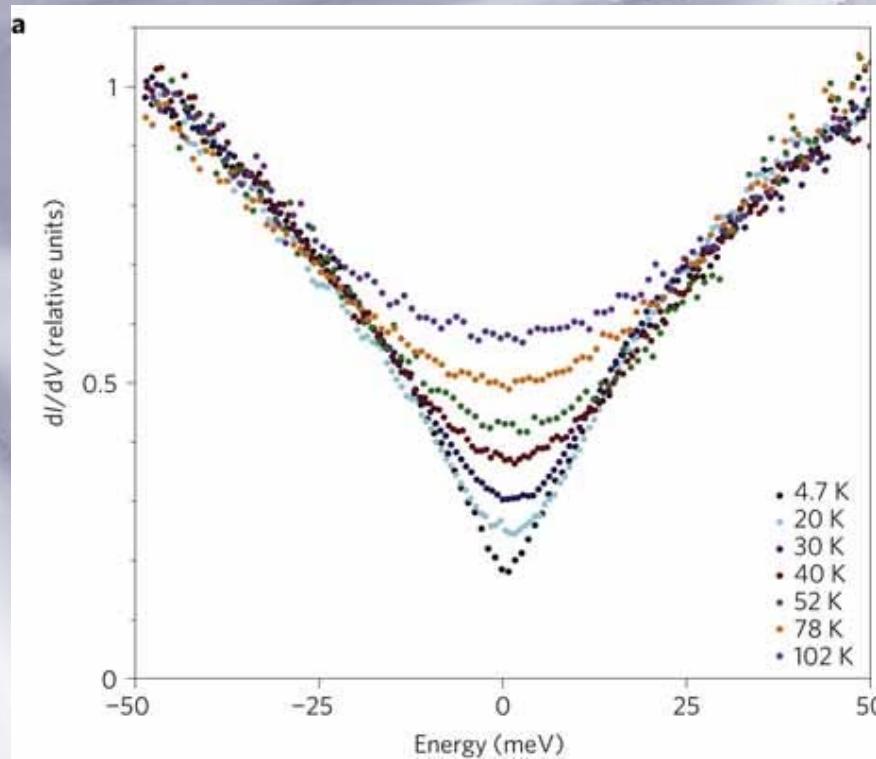

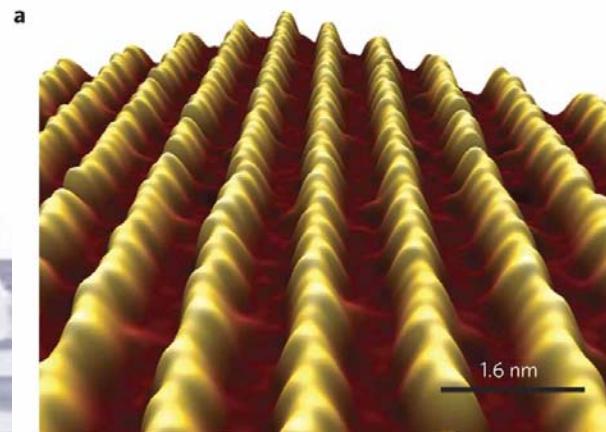

Physics in 1D

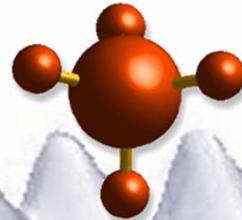

e-e interactions are more important in 1D
than in 2D & 3D (Luttinger Liquid Theory)
Electron -> spin/charge separation
Linear dispersion relations: $E(k) \sim k$
Suppression of DOS near Fermi edge

Au/Ge(001)

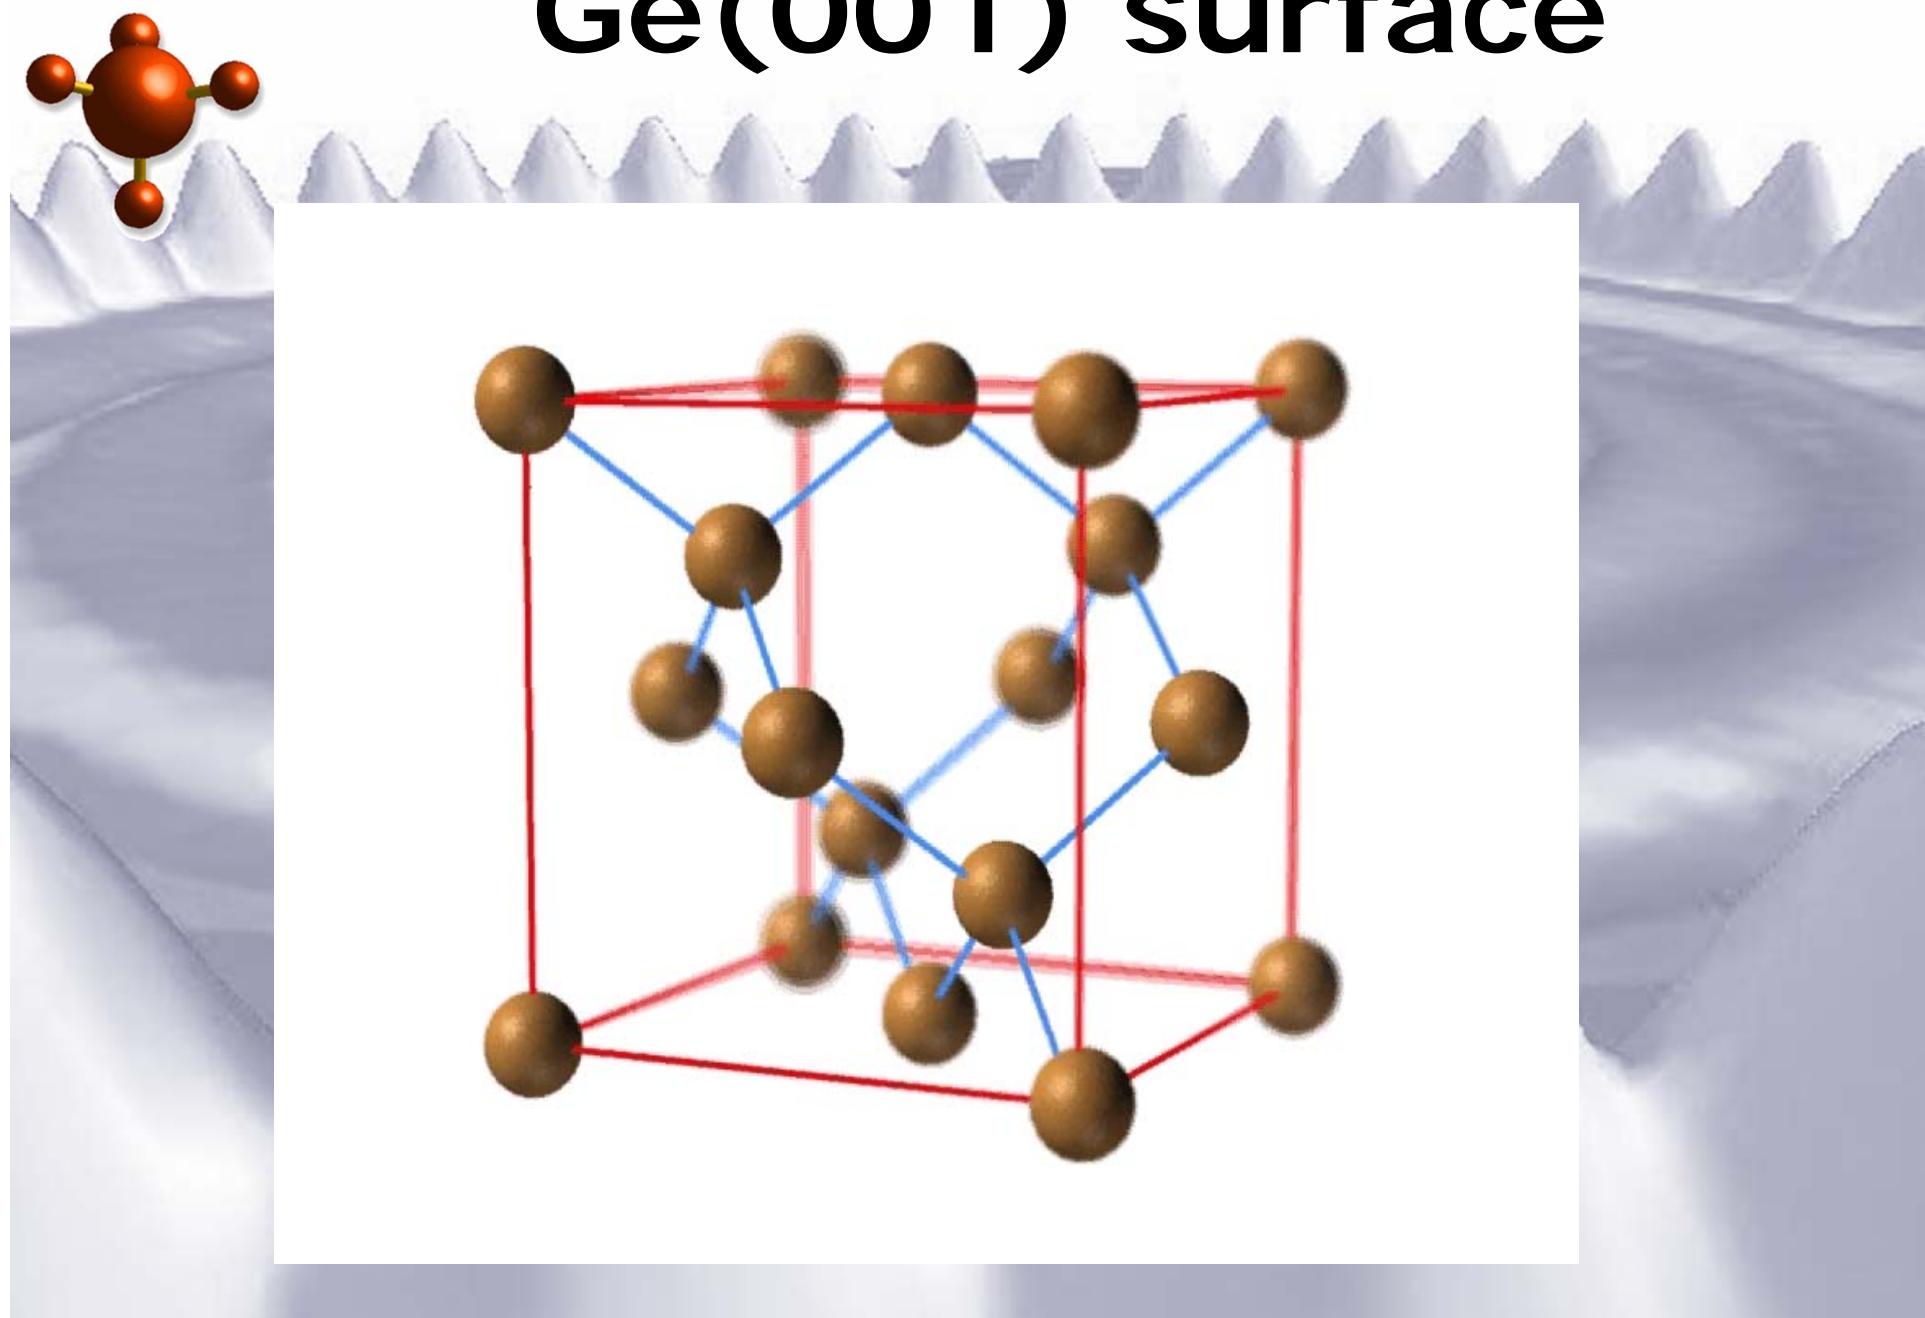

Universal scaling behaviour of $D(E)$
C. Blumenstein et al. Nature Physics 7, 776 (2011)
